

Evaluation of the TMS Software Requirements Specification

Denis Schatzmann

June 11, 2026

The answers refer to the final version 1.0 of the TMS SRS, dated January 2003.

1 Who created the final version?

Version 1.0 (31 December 2002) was revised by Osamah Yacoub and Ahmad Arrabi. The document was produced by AlliedSoft for the USAID AMIR Program in Jordan.

2 What is the intended use?

To capture the complete TMS requirements as a basis for client approval, design, development and testing. The system itself is a Web based system for MoICT to acquire and track training and testing of Government of Jordan (GoJ) employees.

3 Who are the intended users?

The actors in section 4.2: System Administrator, PMU Administrator, TP Administrator, Training Coordinator (TC) and GoJ Employee, each with different access rights.

4 What is the standard environment?

A Web based application over Internet or intranet, using Internet Explorer 5.0 or above at 800 by 600 resolution, in English or Arabic, on a 3-tier architecture with XML. The runtime hardware and software are supplied by the client.

5 Evaluation of a functional requirement

FR19.4 RFI Response Attachment: an RFI Response can attach a binary file of 2 MB maximum.

- Complete: partly, the allowed file formats are not stated.
- Accurate: partly, it conflicts with Assumption 10 and use case 4.3.14 on whether one or several attachments are allowed.
- Unambiguous: no, “binary file” and the number of files are unclear.
- Traceable: yes, the ID FR19.4 links to use cases 4.3.14 and 4.3.15.
- Testable: yes, a file up to 2 MB is accepted and a larger one rejected.

6 Is there a requirement regarding data security?

Yes. Section 5.2 defines role based access with four levels (SEC01 PMU full control, SEC02 TP Administrators, SEC03 Training Coordinators, SEC04 GoJ Employees), enforced by the Login use case. It covers only authentication and authorisation, not encryption, backup or audit logging.

7 Is there a requirement how the software should be designed?

Yes. SYS03 requires a 3-tier architecture with XML for interoperability with future e-Government applications, as also shown in section 3. DOC02 additionally requires a separate software design specification document.
